

New GHX-3D™

3D Encoder / Decoder

The GHX-3D enables 2D equipment to work with 3D content.

The GHX-3D encodes 2 separate left and right eye streams into a single 2D stream that can be recorded on a standard 2D tape machine or server.

To decode, simply feed the single encoded stream into a GHX-3D, and it will generate a 3D stream in several ways including:

- Two separate SDI links, one for left eye and one for right eye
- One SDI, HDMI or DVI stream using Side by Side, Checkerboard or any other standard 3D format.

In conjunction with the Doremi Asset Manager software, 3D content can be generated from image sequences to convert the Nugget or V1-UHD into a 3D playback device.
